

Table of Contents

Table of Contents.....	i
Acknowledgment.....	iii
1. Importance and Use of Consolidated-Undrained Triaxial Tests	1
Soil Tested.....	1
2. Behavior of Compacted Clay.....	2
Background	2
Structure	3
Volume Change Behavior of Compacted Clay	4
Strength of Compacted Clay	4
Failure Criterion	7
Laboratory vs. Field Behavior.....	8
Compaction Specifications and Field Variability.....	8
3. Specimen Compaction	11
Harvard Miniature Compactive Effort	11
4. Consequences of Poor ICU Test Procedure	16
Saturation Phase	16
Consolidation Phase.....	17
Shear Behavior.....	19
Summary – Poor Test Procedure	23
5. Saturation of Compacted Clay	24
Tracking Volume Changes during Saturation.....	24
Examples of Volume Change during Saturation	25
Effect of Confining Stress during Saturation.....	27
Tests with Different σ'_{3sat} and Different σ'_{3c}	28
Tests with Different σ'_{3sat} and the Same σ'_{3c}	32
Relating Laboratory and Field Conditions.....	37
Summary – Saturation of Compacted Clay	39
6. Effect of Compaction Conditions on Consolidated-Undrained Strengths and Stress-Strain Properties.....	41
Volume Change during Saturation and Consolidation.....	42
Undrained Shear	45

Undrained Strength..... 48

Effective Stress Strength Envelopes..... 52

Application to Rapid Drawdown Analysis 55

Summary – Effect of Compaction Conditions 58

7. Conclusions 59

 Sample Compaction 59

 Consequences of Poor ICU Test Procedure 59

 Saturation..... 59

 Effect of Compaction Conditions 60

8. References 61

Appendix: Triaxial Compression Test Results..... 65
